

1 Authorize A/B

An independent person (A) or protected automation (B) approves the Delivery Contract before it is issued.

2 Merge check

The CEED Router checks every changed file and the required evidence for the exact change.

3 Rollout check

At each required stage, the CEED Router checks the plan and evidence first.

Learn

Production results and later incidents join the same record, so the team can learn from them.

Figure 1. The CEED delivery path

Each change is authorized before coding in the recommended sequence, checked at merge and at every required rollout stage, and recorded with its production results in one Change Passport.
