Evidence stage	Published evidence and how to use it
Defined behavior	The CEED Specification defines records, authorization, exact-candidate checks, required release checkpoints and reporting, giving independent implementations one published rulebook.
Recorded checks	The CEED Conformance Pack records 1,967 executed checks for the snapshot identified in its Guide, with expected results and a coverage map, so builders can reproduce the published cases and compare their implementation's decisions.
Worked example	CEED in Practice follows one change through its stored records: an out-of-scope billing edit is blocked, a narrow new CEED Delivery Contract version is authorized, and both decisions stay in the CEED Change Passport, so readers can follow the authorization rule through a complete example. See CEED Router & Version 1.0 for implementation and release details.
Independent testing and a one-change trial	Independent builders can test agreement on the shared rules. Try the CEED Framework on one change with existing tools and CEED in Practice, then measure delivery time, review effort and investigation work in a bounded operational pilot to assess the effect in your environment.

CEED evidence available for inspection

Defined rules and executable cases give builders a shared basis for implementation.
